

Living with low and zero carbon technology

Solar panels, Heat pumps, MVHR

Nicola Terry

What you need to know

- What does it do?
- How do I know it is working
- Is there anything I should be doing/not doing?
- Should it really be making that noise?
- What maintenance does it need?

Solar PV panels

- How do I know it is working?
 - Check the generation meter
- What should I do?
 - Use the power when you have it
 - Possibly heat your hot water tank

Hot water panels

Set the backup heating timer for early evening

- Check the hot water tank is heating up
- Service every 5 years (?)

Heat pumps

- Feel the radiators/floor
 - Warm but not hot
 - Keep them clear

Use a book to
test underfloor
heating

- Efficiency depends on the circulation temperature, not the thermostat (except for high temperature heat pumps).
- Auxiliary heaters should only come on rarely
- Keep the fans clear and the de-icer drain
- Regular service

MVHR

- Can you hear it working?
- Do the rooms feel stuffy?
- Keep windows closed
- Use boost setting for extra throughput e.g. wet paint or new furniture
- Summer time: turn off /use for cooling
- *** **Clean/replace the filters** ****
